*n*th Roots and Rational Exponents

What you should learn

7.1

GOAL Evaluate *n*th roots of real numbers using both radical notation and rational exponent notation.

GOAL 2 Use *n*th roots to solve **real-life** problems, such as finding the total mass of a spacecraft that can be sent to Mars in **Example 5**.

Why you should learn it

▼ To solve **real-life** problems, such as finding the number of reptile and amphibian species that Puerto Rico can support in **Ex. 67**.

GOAL 1

EVALUATING NTH ROOTS

You can extend the concept of a square root to other types of roots. For instance, 2 is a cube root of 8 because $2^3 = 8$, and 3 is a fourth root of 81 because $3^4 = 81$. In general, for an integer *n* greater than 1, if $b^n = a$, then *b* is an *n***th root of** *a*. An *n*th root of *a* is written as $\sqrt[n]{a}$, where *n* is the **index** of the radical.

You can also write an *n*th root of *a* as a power of *a*. For the particular case of a square root, suppose that $\sqrt{a} = a^k$. Then you can determine a value for *k* as follows:

$\sqrt{a} \cdot \sqrt{a} = a$	Definition of square root
$a^k \cdot a^k = a$	Substitute a^k for \sqrt{a} .
$a^{2k} = a^1$	Product of powers property
2k = 1	Set exponents equal when bases are equal
$k = \frac{1}{2}$	Solve for <i>k</i> .

Therefore, you can see that $\sqrt{a} = a^{1/2}$. In a similar way you can show that $\sqrt[3]{a} = a^{1/3}$ and $\sqrt[4]{a} = a^{1/4}$. In general, $\sqrt[n]{a} = a^{1/n}$ for any integer *n* greater than 1.

REAL NTH ROOTS

Let *n* be an integer greater than 1 and let *a* be a real number.

- If *n* is odd, then *a* has one real *n*th root: $\sqrt[n]{a} = a^{1/n}$
- If *n* is even and a > 0, then *a* has two real *n*th roots: $\pm \sqrt[n]{a} = \pm a^{1/n}$
- If *n* is even and a = 0, then *a* has one *n*th root: $\sqrt[n]{0} = 0^{1/n} = 0$
- If *n* is even and *a* < 0, then *a* has no real *n*th roots.

EXAMPLE 1 Finding

Finding nth Roots

Find the indicated real *n*th root(s) of *a*.

.
$$n = 3, a = -125$$
 b. $n = 4, a = 16$

SOLUTION

а

a. Because n = 3 is odd, a = -125 has one real cube root. Because $(-5)^3 = -125$, you can write:

 $\sqrt[3]{-125} = -5$ or $(-125)^{1/3} = -5$

b. Because n = 4 is even and a = 16 > 0, 16 has two real fourth roots. Because $2^4 = 16$ and $(-2)^4 = 16$, you can write:

$$\pm \sqrt[4]{16} = \pm 2$$
 or $\pm 16^{1/4} = \pm 2$

A rational exponent does not have to be of the form $\frac{1}{n}$ where *n* is an integer greater than 1. Other rational numbers such as $\frac{3}{2}$ and $-\frac{1}{2}$ can also be used as exponents.

RATIONAL EXPONENTS

Let $a^{1/n}$ be an *n*th root of *a*, and let *m* be a positive integer.

- $a^{m/n} = (a^{1/n})^m = (\sqrt[n]{a})^m$
- $a^{-m/n} = \frac{1}{a^{m/n}} = \frac{1}{(a^{1/n})^m} = \frac{1}{(\sqrt[n]{a})^m}, a \neq 0$

EXAMPLE 2 Evaluating Expressions with Rational Exponents

а	$9^{3/2} = (\sqrt{9})^3 = 3^3 = 27$	Using radica	al notation
	$9^{3/2} = (9^{1/2})^3 = 3^3 = 27$	Using ration	al exponent notation
b	$32^{-2/5} = \frac{1}{32^{2/5}} = \frac{1}{(\sqrt[5]{32})^2} =$	$\frac{1}{2^2} = \frac{1}{4}$	Using radical notation
	$32^{-2/5} = \frac{1}{32^{2/5}} = \frac{1}{(32^{1/5})^2} =$	$\frac{1}{2^2} = \frac{1}{4}$	Using rational exponent notation

When using a graphing calculator to approximate an *n*th root, you may have to rewrite the *n*th root using a rational exponent. Then use the calculator's power key.

EXAMPLE 3 Approximating a Root with a Calculator

Use a graphing calculator to approximate $(\sqrt[4]{5})^3$.

SOLUTION First rewrite $(\sqrt[4]{5})^3$ as $5^{3/4}$. Then enter the following:

Keystrokes: 5 $(3 \div 4)$ ENTER Display: 3.343701525 $(\sqrt[4]{5})^3 \approx 3.34$

To solve simple equations involving x^n , isolate the power and then take the *n*th root of *each* side.

EXAMPLE 4 Solving Equations Using nth Roots

a. $2x^4 = 162$	b. $(x-2)^3 = 10$
$x^4 = 81$	$x - 2 = \sqrt[3]{10}$
$x = \pm \sqrt[4]{81}$	$x = \sqrt[3]{10} + 2$
$x = \pm 3$	$x \approx 4.15$

► Study Tip To use a scientific calculator in Example 3, replace ▲ with ✓ and replace ENTER with ■.

GOAL 2 USING NTH ROOTS IN REAL LIFE

Evaluating a Model with nth Roots

EXAMPLE 5

The total mass M (in kilograms) of a spacecraft that can be propelled by a magnetic sail is, in theory, given by

$$M = \frac{0.015m^2}{fd^{4/3}}$$

where *m* is the mass (in kilograms) of the magnetic sail, *f* is the drag force (in newtons) of the spacecraft, and *d* is the distance (in astronomical units) to the sun. Find the total mass of a spacecraft that can be sent to Mars using m = 5000 kg, f = 4.52 N, and

d = 1.52 AU. Source: Journal of Spacecraft and Rockets

Artist's rendition of a magnetic sail

SOLUTION

$$M = \frac{0.015m^2}{fd^{4/3}}$$
 Write model for total mass
$$= \frac{0.015(5000)^2}{4.52(1.52)^{4/3}}$$
 Substitute for *m*, *f*, and *d*.
$$\approx 47,500$$
 Use a calculator.

The spacecraft can have a total mass of about 47,500 kilograms. (For comparison, the liftoff weight for a space shuttle is usually about 2,040,000 kilograms.)

NAUTICAL SCIENCE The *Olympias* is a reconstruction of a trireme, a type of Greek galley ship used over 2000 years ago. The power P (in kilowatts) needed to propel the *Olympias* at a desired speed s (in knots) can be modeled by this equation:

$$P = 0.0289s^3$$

A volunteer crew of the *Olympias* was able to generate a maximum power of about 10.5 kilowatts. What was their greatest speed? Source: Scientific American

SOLUTION

$\mathbf{P} = 0.0289s^3$	Write model for power.
$10.5 = 0.0289s^3$	Substitute 10.5 for <i>P</i> .
$363 \approx s^3$	Divide each side by 0.0289.
$\sqrt[3]{363} \approx s$	Take cube root of each side.
$7 \approx s$	Use a calculator.

The greatest speed attained by the *Olympias* was approximately 7 knots (about 8 miles per hour).

NAUTICAL SCIENCE The Olympias was completed and first launched in 1987. A crew of 170 rowers is needed to run the ship.

GUIDED PRACTICE

Vocabulary Check
Concept Check

- **1.** What is the index of a radical?
- **2. LOGICAL REASONING** Let *n* be an integer greater than 1. Tell whether the given statement is *always true*, *sometimes true*, or *never true*. Explain.

a. If
$$x^n = a$$
, then $x = \sqrt[n]{a}$.

b.
$$a^{1/n} = \frac{1}{a^n}$$

3. Try to evaluate the expressions $-\sqrt[4]{625}$ and $\sqrt[4]{-625}$. Explain the difference in your results.

Skill Check

Evaluate the expression. **4.** $\sqrt[4]{81}$ **5.** $-(49^{1/2})$ **6.** $(\sqrt[3]{-8})^5$ **7.** $3125^{2/5}$

Solve the equation.

- **8.** $x^3 = 125$ **9.** $3x^5 = -3$ **10.** $(x + 4)^2 = 0$ **11.** $x^4 7 = 9993$
- **12. SHOT PUT** The shot (a metal sphere) used in men's shot put has a volume of about 905 cubic centimeters. Find the radius of the shot. (*Hint:* Use the formula $V = \frac{4}{3}\pi r^3$ for the volume of a sphere.)
